

Personal Security Hygiene Checklist

Password Strength

- ☐ **Length:** My passwords are at least 16 characters long
 - Shorter passwords are exponentially easier to crack
 - Every added character increases security dramatically

 - ☐ **Complexity:** I use a mix of:
 - Uppercase letters (A-Z)
 - Lowercase letters (a-z)
 - Numbers (0-9)
 - Symbols (!@#\$%^&*)

 - ☐ **Uniqueness:** I never reuse passwords
 - Different password for every account
 - Especially critical: Email, Banking, Work accounts

 - ☐ **No Personal Info:** My passwords don't contain:
 - My name, username, or email
 - Birthdays or anniversaries
 - Phone numbers
 - Pet names or family names
-

Password Manager

- ☐ **Using a Manager:** I use a password manager
 - Bitwarden (open-source, free)
 - 1Password (family plans)
 - Dashlane
 - LastPass
 - Keeper

Why? You can't remember 100+ unique complex passwords. Let software do it.

- ☐ **Master Password:** My master password is:

- 20+ characters
 - Memorized (not written down)
 - Never used anywhere else
-

Two-Factor Authentication (2FA)

- ☐ **Email:** 2FA enabled ✓
- ☐ **Banking:** 2FA enabled ✓
- ☐ **Social Media:** 2FA enabled ✓
- ☐ **Work Accounts:** 2FA enabled ✓
- ☐ **Cloud Storage:** 2FA enabled ✓

Best 2FA Methods (in order)

1. **Hardware Key** (YubiKey, Titan Key)
 2. **Authenticator App** (Google Authenticator, Authy)
 3. **SMS** (better than nothing, but vulnerable to SIM swapping)
- ☐ I avoid SMS 2FA when better options exist
-

Account Security

Email Security

- ☐ I have a unique password for each email account
- ☐ I've enabled 2FA on all email accounts
- ☐ I regularly check "Devices & Activity" for unauthorized access
- ☐ I use email aliases for different services (e.g., shopping@, work@)

Financial Accounts

- ☐ Banking apps require biometric + password
- ☐ I've set up transaction alerts
- ☐ I review account activity weekly
- ☐ I've frozen my credit (when not applying for credit)

Social Media

- ☐ Private profile settings reviewed
- ☐ 2FA enabled
- ☐ Removed unused third-party app access
- ☐ Reviewed tagged photos and mentions

Common Mistakes to Avoid

✗ Don't Do This:

- Writing passwords on sticky notes
- Saving passwords in browser (unless encrypted)
- Sharing passwords via email/text
- Using "password123" or "qwerty"
- Same password for multiple sites
- Clicking "Remember me" on shared computers

✓ Do This Instead:

- Use a password manager
- Generate random passwords
- Use unique password per site
- Log out of shared computers
- Use passphrases (correct-horse-battery-staple)

Passphrase Alternative

Instead of: `P@ssw0rd123!`

Try: `correct-horse-battery-staple-47`

Benefits:

- Easier to remember
- Harder to crack (length > complexity)
- Accepted by most systems
- More secure than complex but short passwords

Creating Strong Passphrases

None

4-6 random common words + number

Example: `turtle-coffee-airplane-sunset-92`

Breach Monitoring

- ☐ I check HaveIBeenPwned.com regularly
- ☐ I've signed up for breach notifications
- ☐ I change passwords immediately after breach news

Service: <https://haveibeenpwned.com/NotifyMe>

Company Password Policy Template

For Standard Employees

- ☐ Minimum 12 characters
- ☐ Mix of uppercase, lowercase, numbers, symbols
- ☐ Rotate every 90 days (for critical accounts)
- ☐ No password reuse (last 5 passwords)
- ☐ 2FA mandatory

For Admin/Root Access

- ☐ Minimum 20 characters
- ☐ Hardware 2FA key required
- ☐ Rotate every 60 days
- ☐ Access logged and monitored
- ☐ Approval required for privilege escalation

For Customer Accounts

- ☐ Minimum 8 characters (12 recommended)
 - ☐ Optional 2FA (encourage adoption)
 - ☐ Password strength meter during creation
 - ☐ Check against common password lists
 - ☐ Account lockout after 5 failed attempts
-

Emergency Access

Personal

- ☐ Designated trusted person has access to:
 - Password manager master password (sealed envelope)
 - 2FA recovery codes
 - Important account information

Business

- ☐ Shared admin credentials in secure vault
 - ☐ Recovery codes backed up securely
 - ☐ Documented emergency access procedure
 - ☐ Regular access audits
-

Mobile Device Security

- ☐ Screen lock enabled (6+ digit PIN or biometric)
 - ☐ Auto-lock after 1-2 minutes
 - ☐ Find My Device enabled
 - ☐ Remote wipe capability set up
 - ☐ App permissions reviewed regularly
 - ☐ OS and apps always updated
-

Quick Security Score

Count your YES answers:

Score	Security Level
20+	Excellent 
15-19	Good 
10-14	Needs Improvement 
<10	Critical Risk 

Secure your organization. Devxhub implements enterprise identity management.
